

# IDEA 使用文档

## 一、IDEA 中的第一个代码

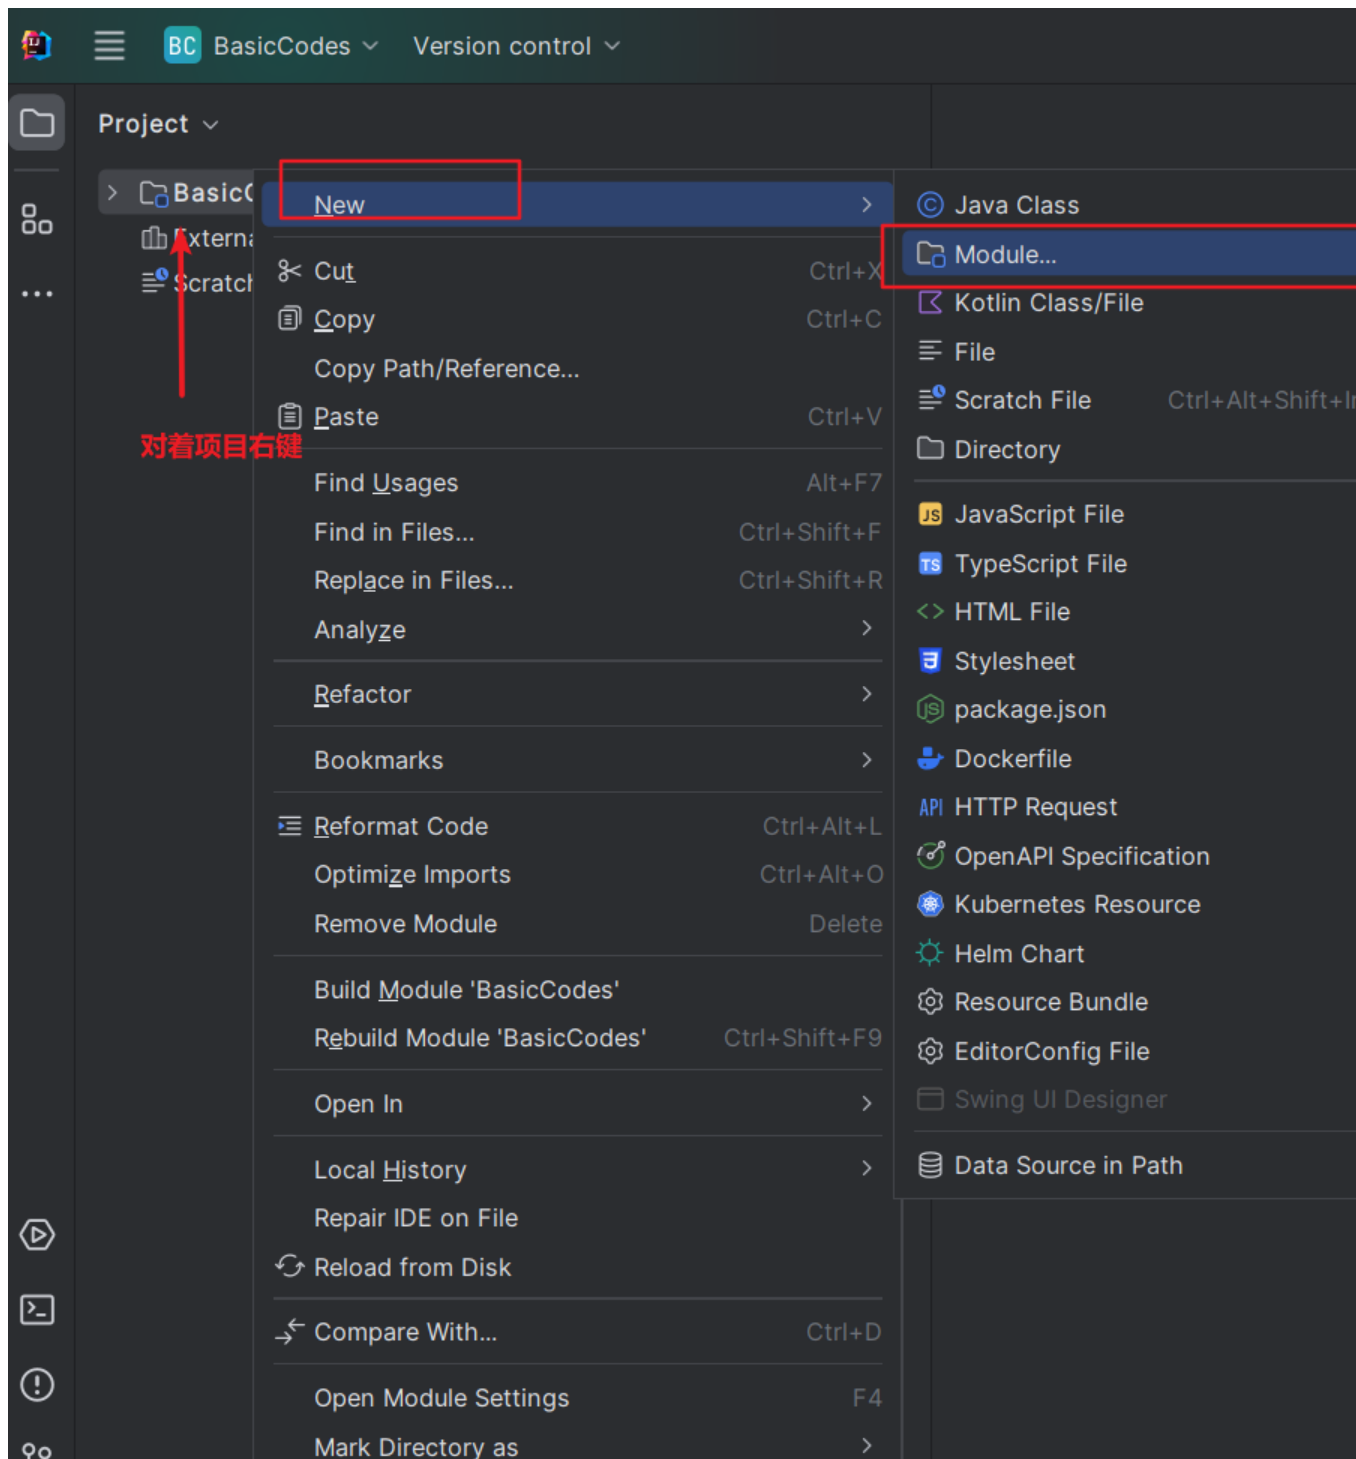

操作步骤：

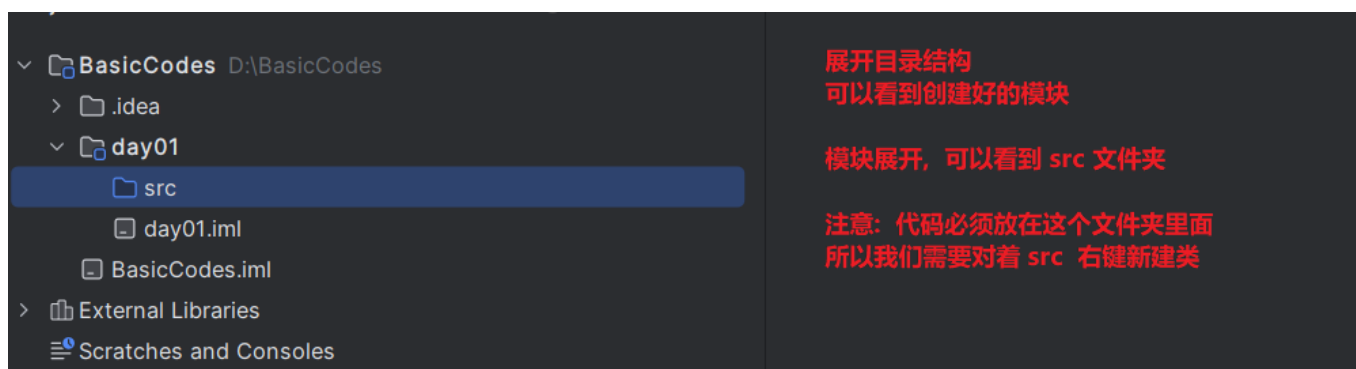

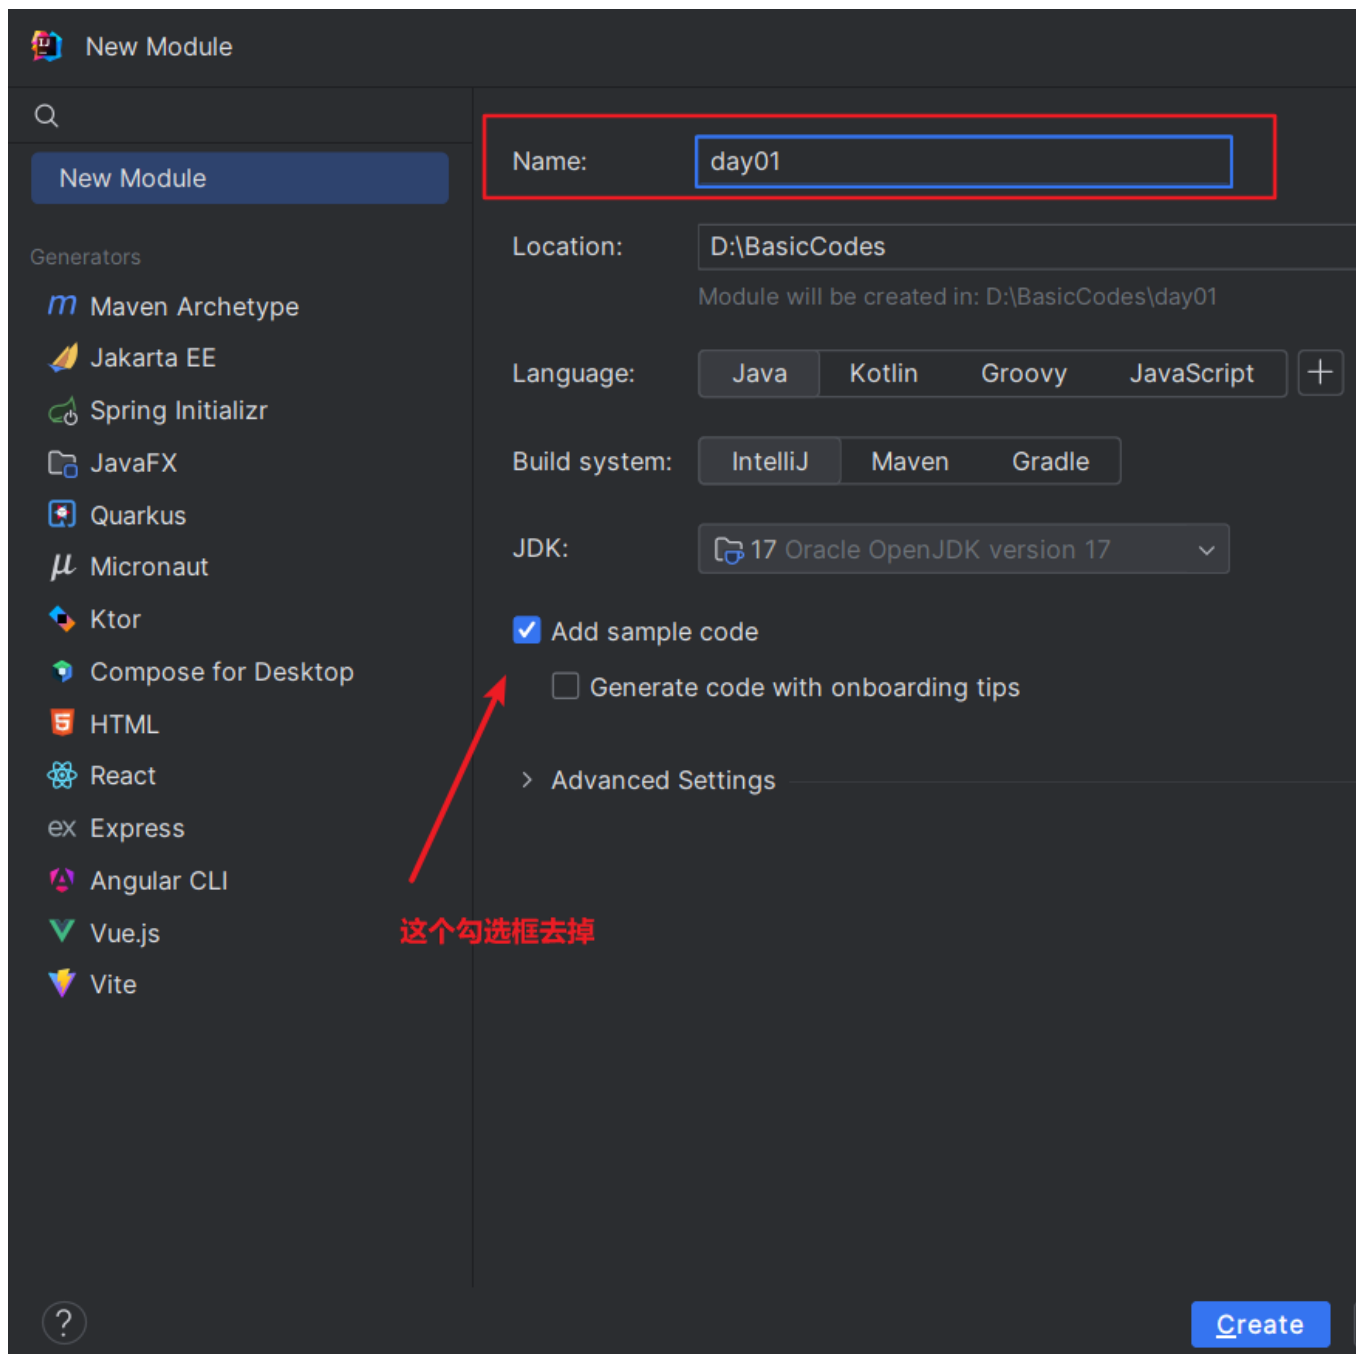

### 1. 创建 Project

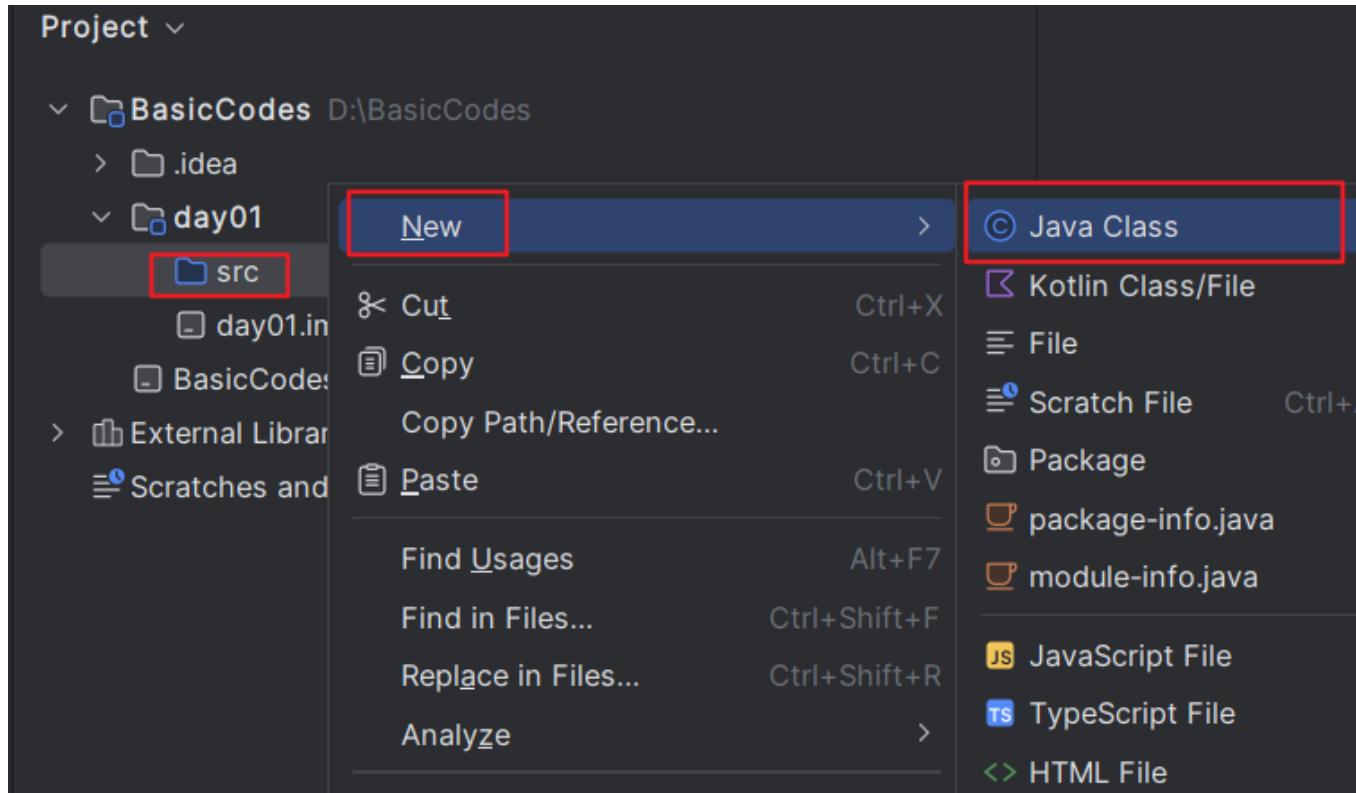

## 2. 创建 Module

tips: 常规来说, 还需要继续在下面创建 Package, 但第一天的话可以先忽略, 等积累到一些代码量之后, 再融入进来。

### 3. 创建 class 类

### 4. 类中编写代码

© IdeaDemo.java ×

```
no usages
1 public class IdeaDemo {
2     psvm|
```

psvm main() method declaration

Press Ctrl+空格 to see non-imported classes Next Tip

输入 psvm + 回车

© IdeaDemo.java ×

```
1 public class IdeaDemo {
2     public static void main(String[] args) {
3         sout
4     }
5 }
6
```

sout Prints a string to System.out

soutm Prints current class and method names to System.out

soutp Prints method parameter names and values to System.out

soutv Prints a value to System.out

Press Enter to insert, Tab to replace Next Tip

sout + 回车

## 5. 完成代码的运行

© IdeaDemo.java ×

```
1 public class IdeaDemo {
2     public static void main(String[] args) {
3         System.out.println("HelloWorld");
4     }
5 }
6
```

点击运行按钮

Run IdeaDemo ×

↑ ↓ ↺ ↻

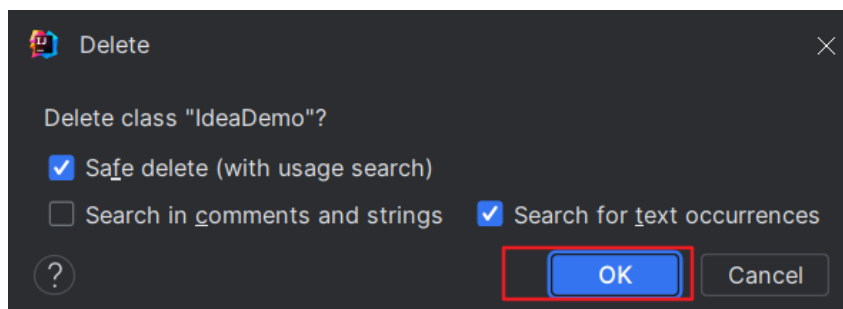

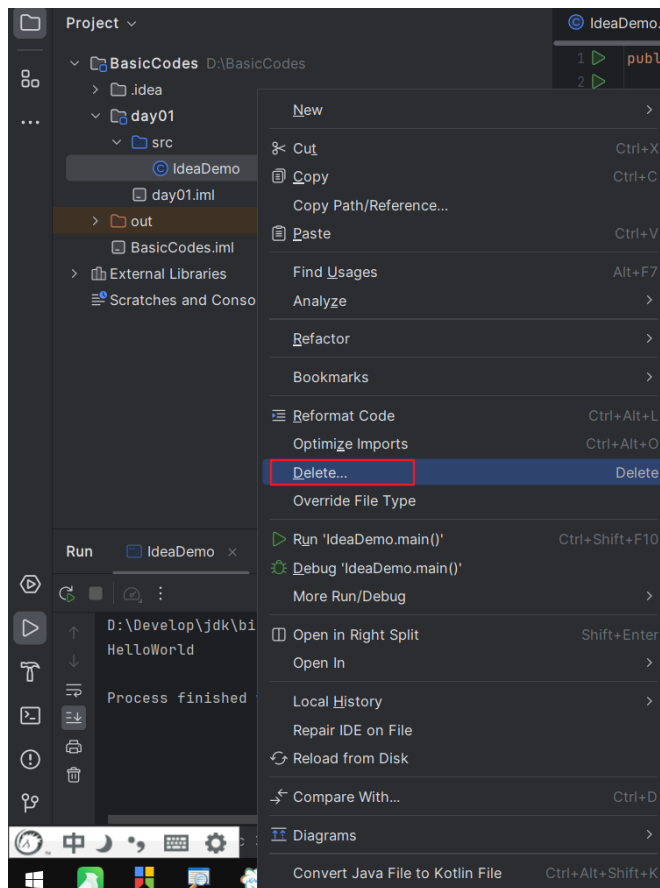

```
D:\Develop\jdk\bin\java.exe "-javaagent:D:\Develop\IntelliJ IDEA 2023.3\lib\id
HelloWorld

Process finished with exit code 0
```

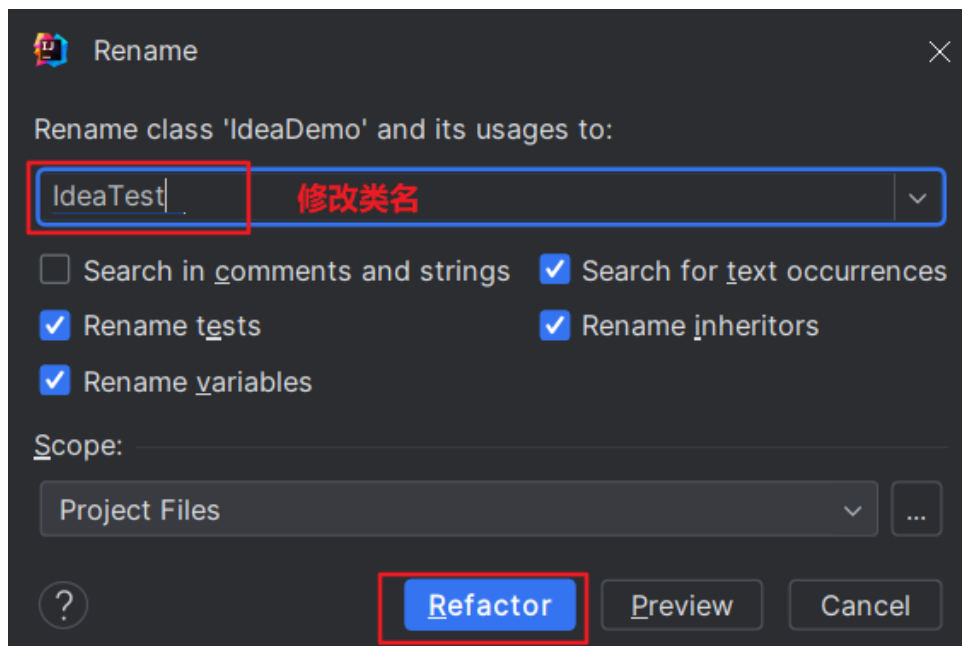

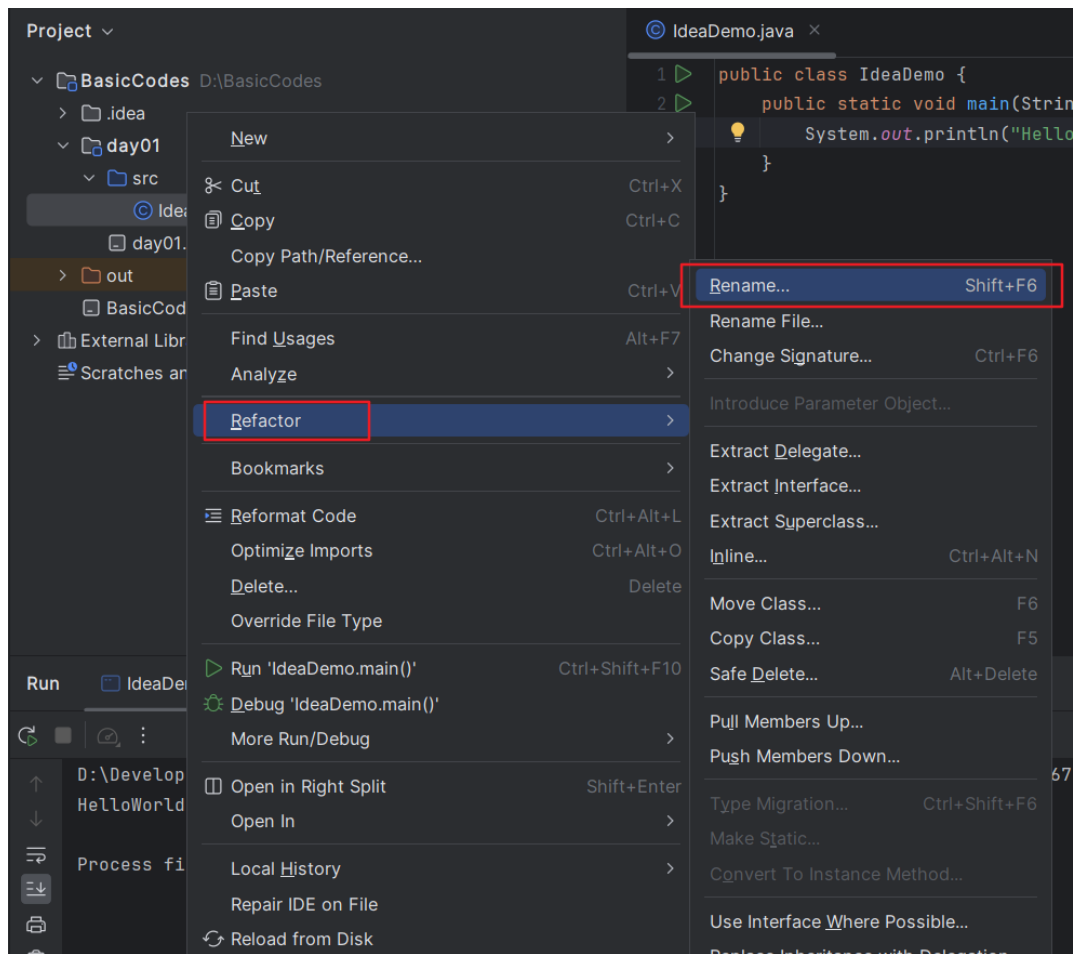

## 二、类操作

A. 新建类：跟刚刚一样

B. 删除类：

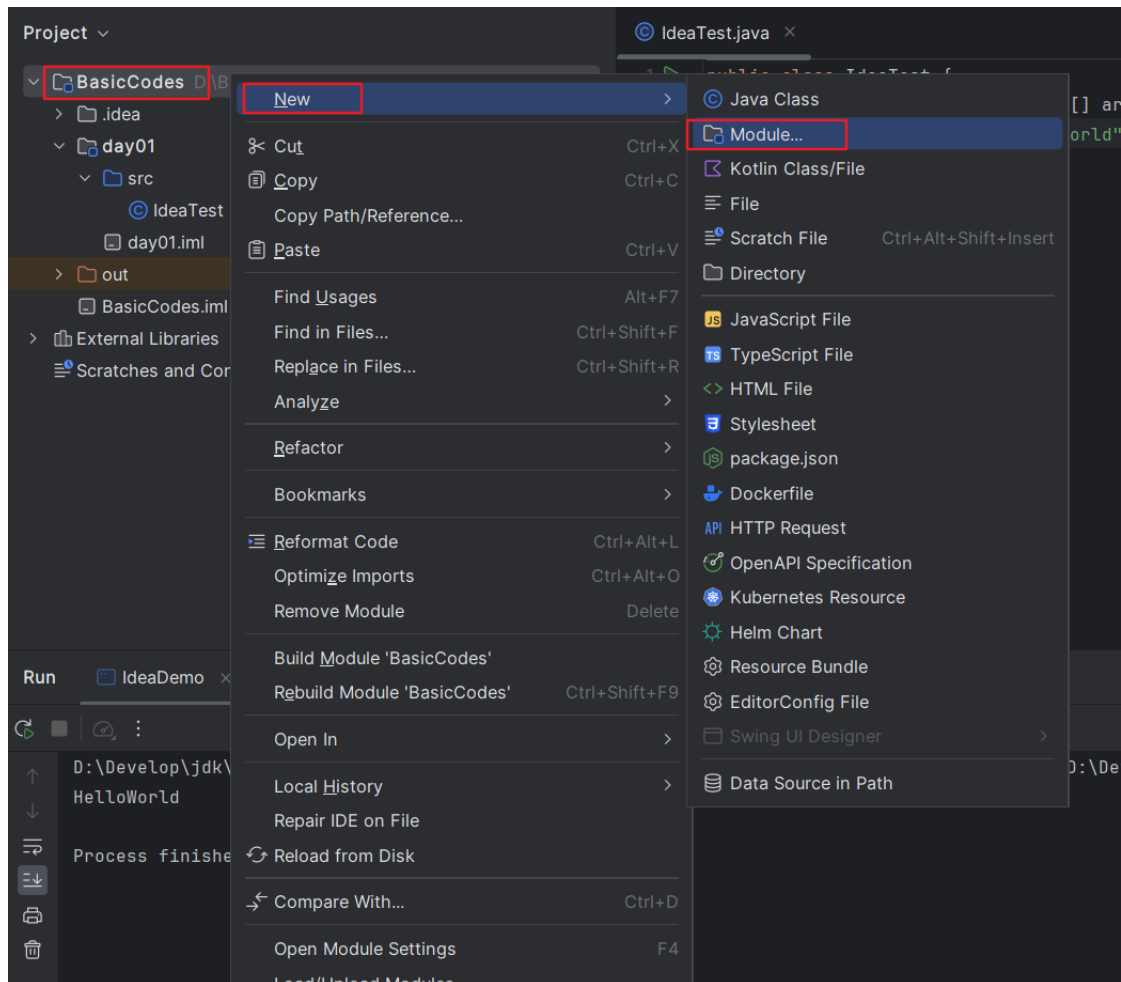

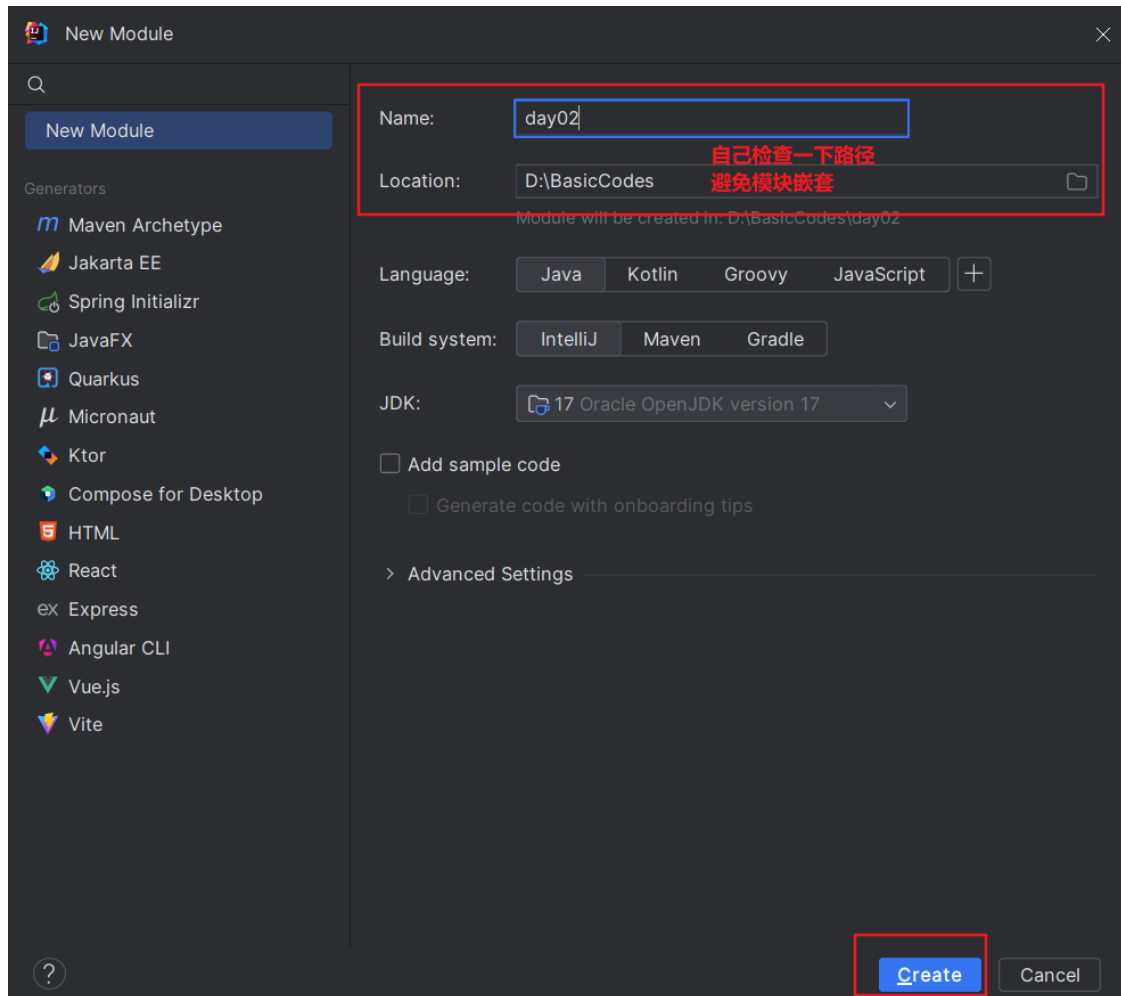

### C. 修改类

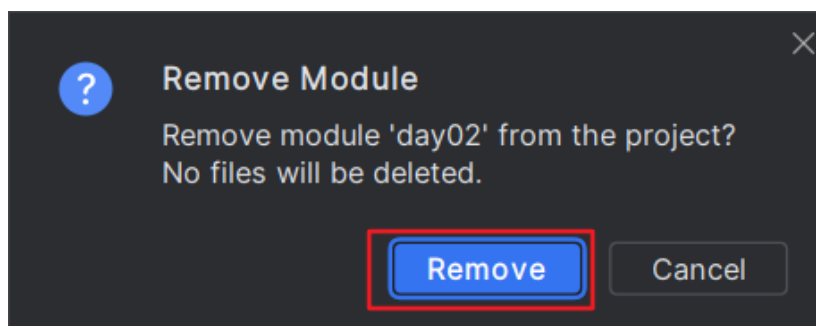

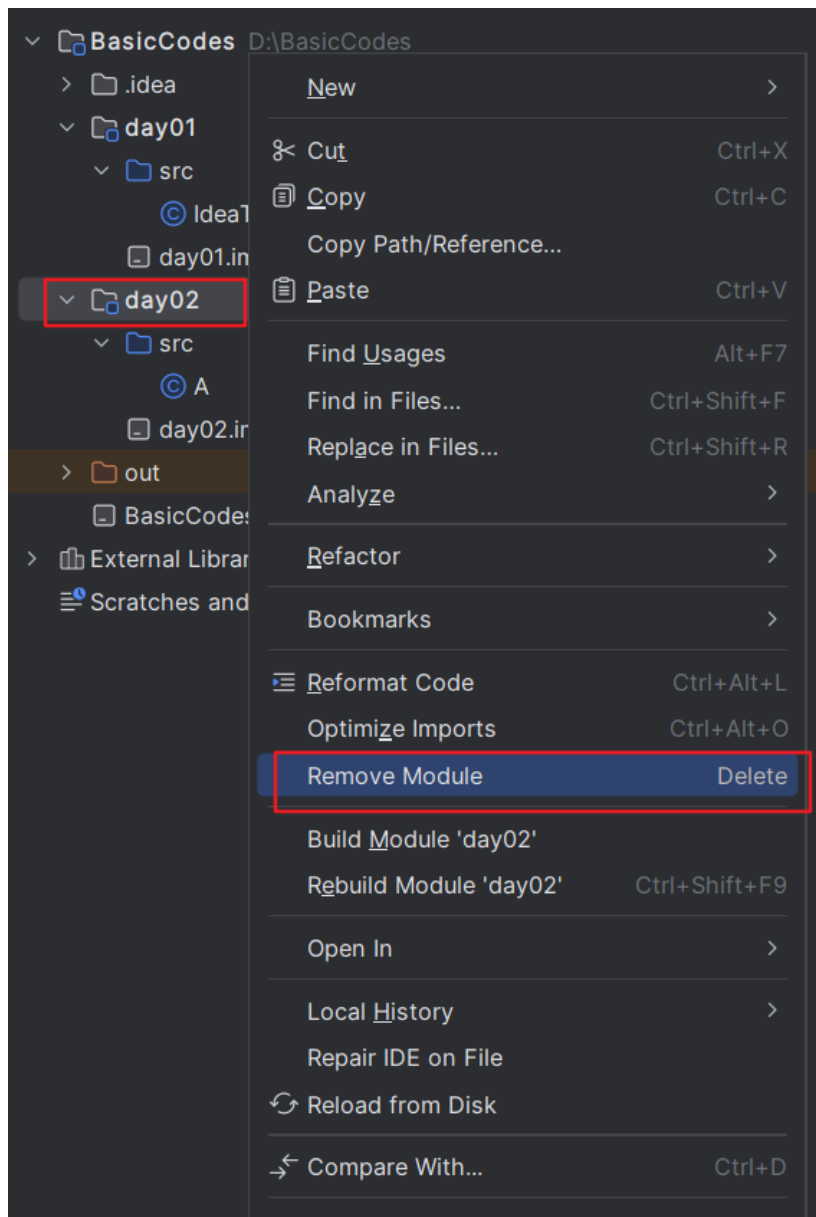

### 三、模块操作

#### A. 新建模块

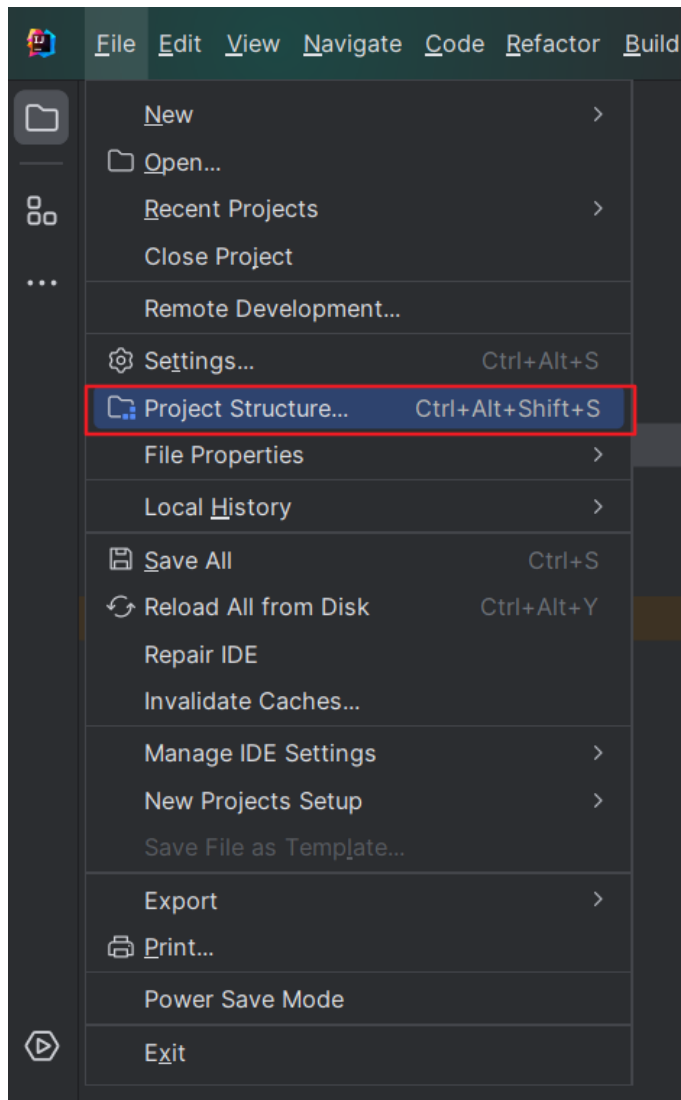

## B. 删除模块

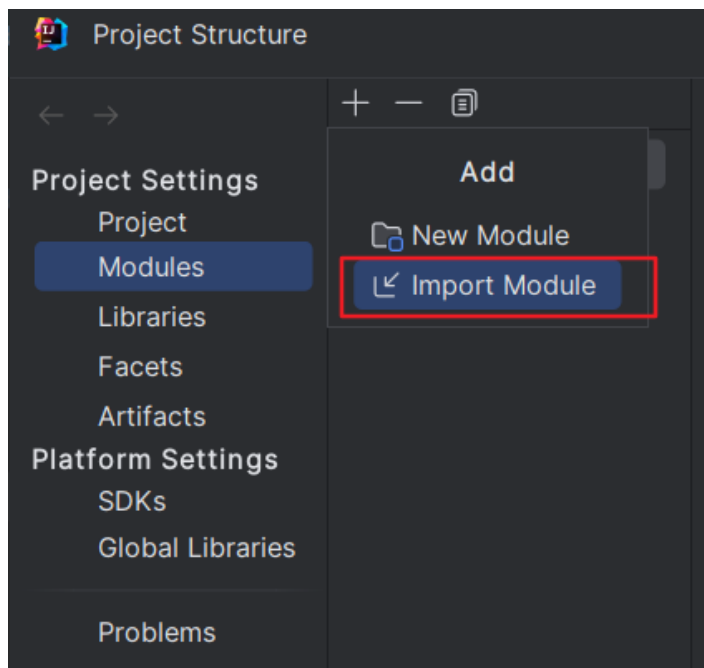

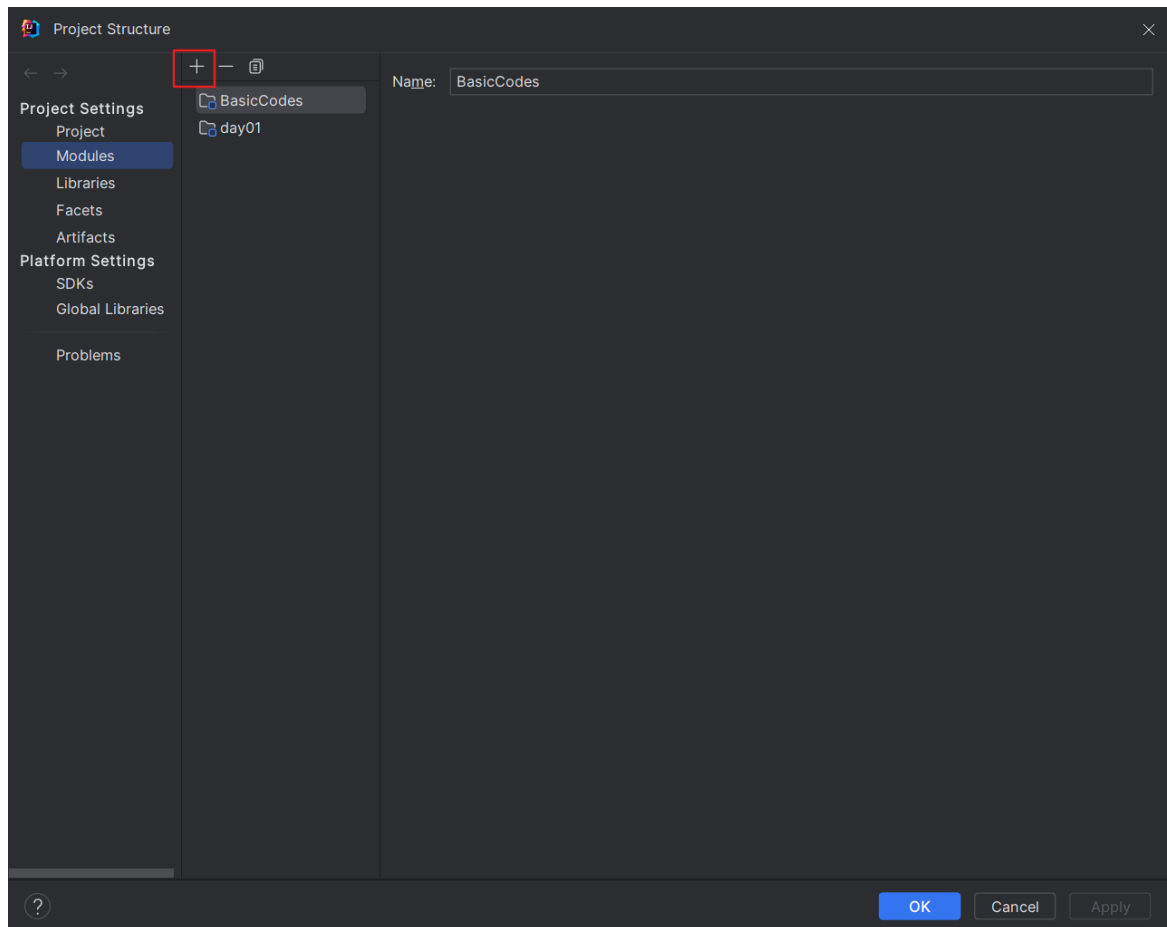

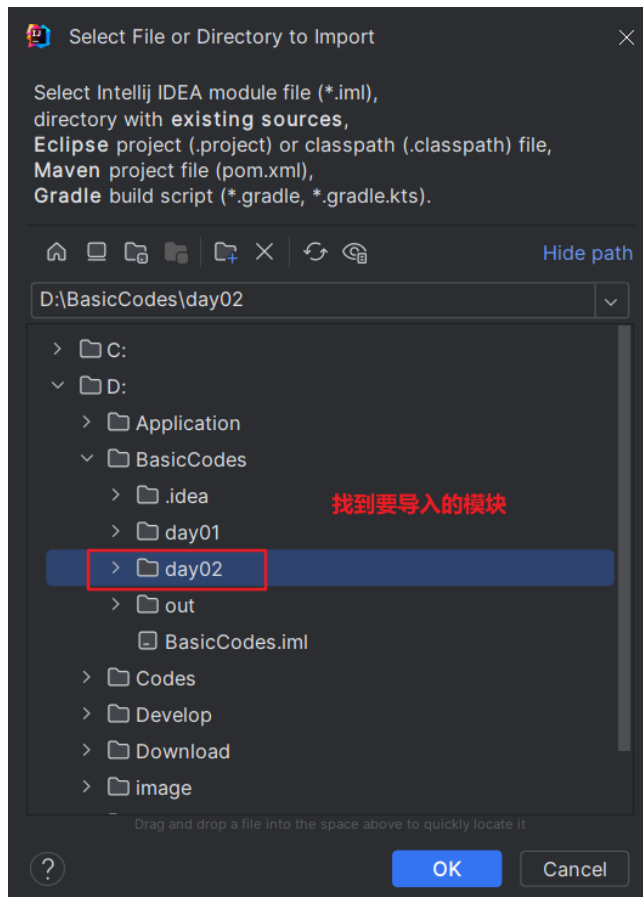

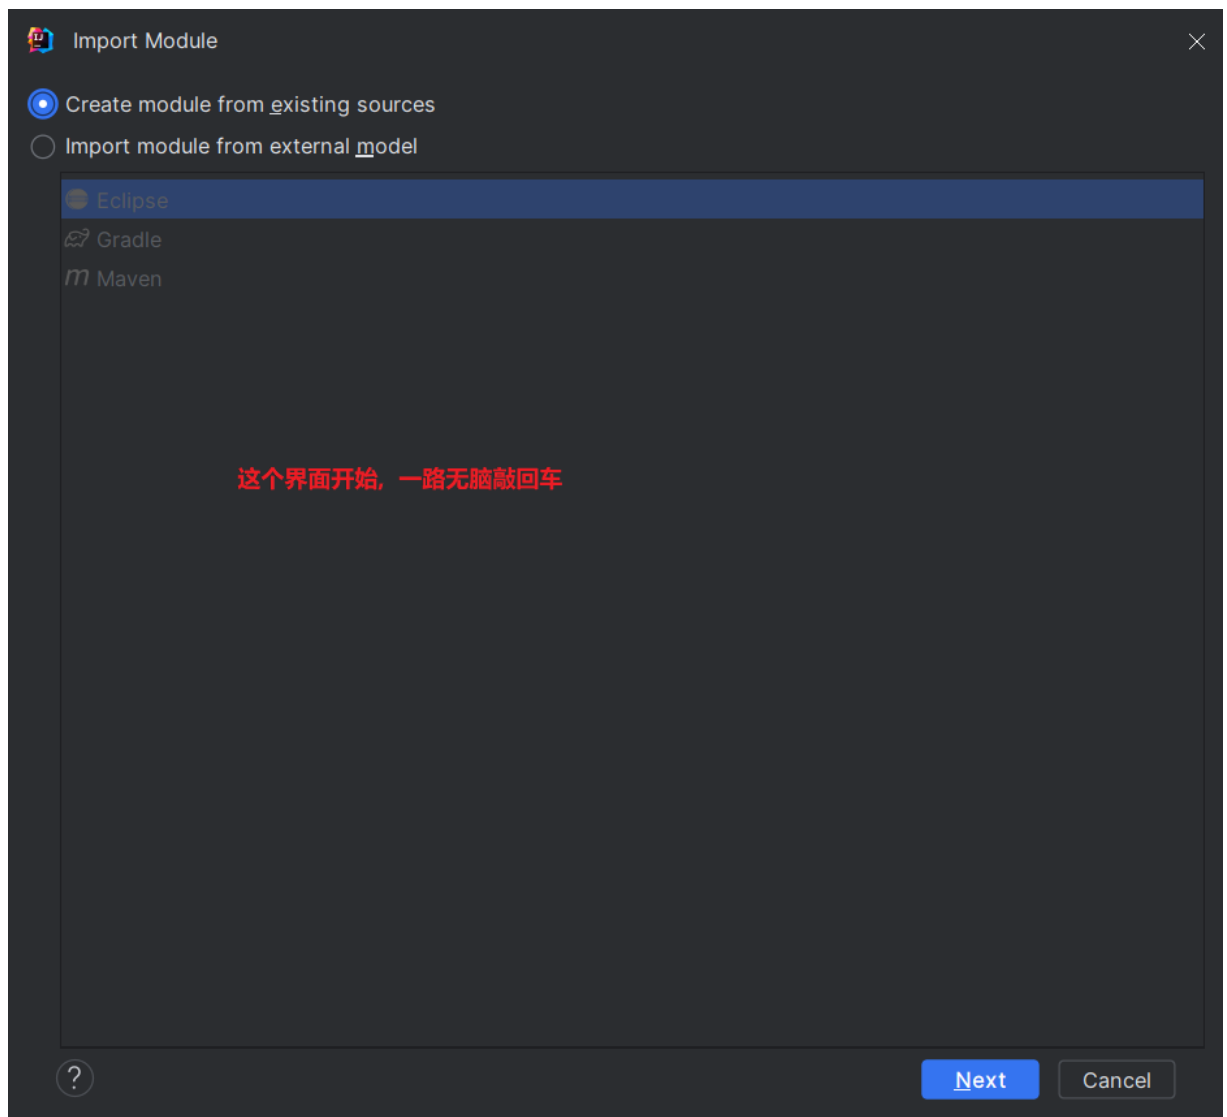

这是正常现象，因为硬盘中这个模块还是存在的，想要完全删除，需要手动到硬盘中删除。

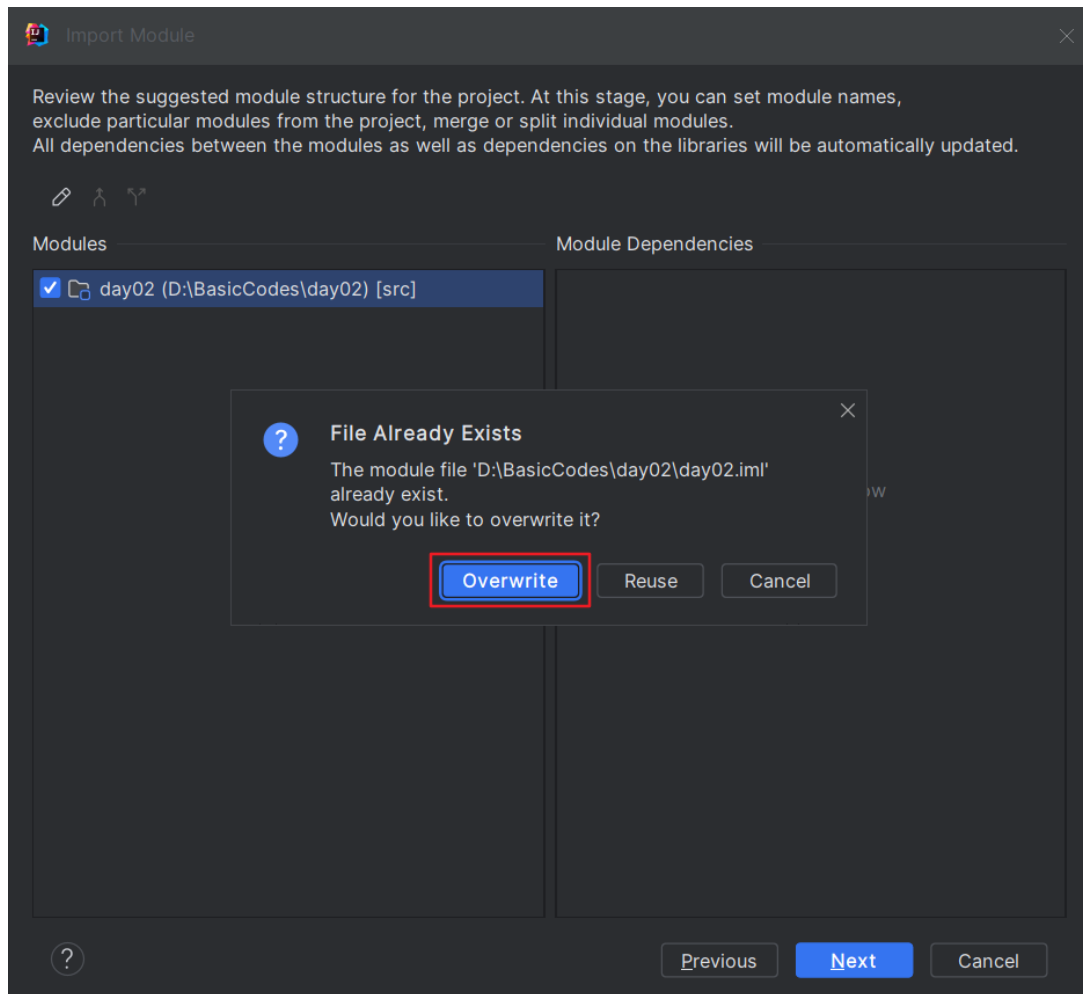

### C. 导入模块

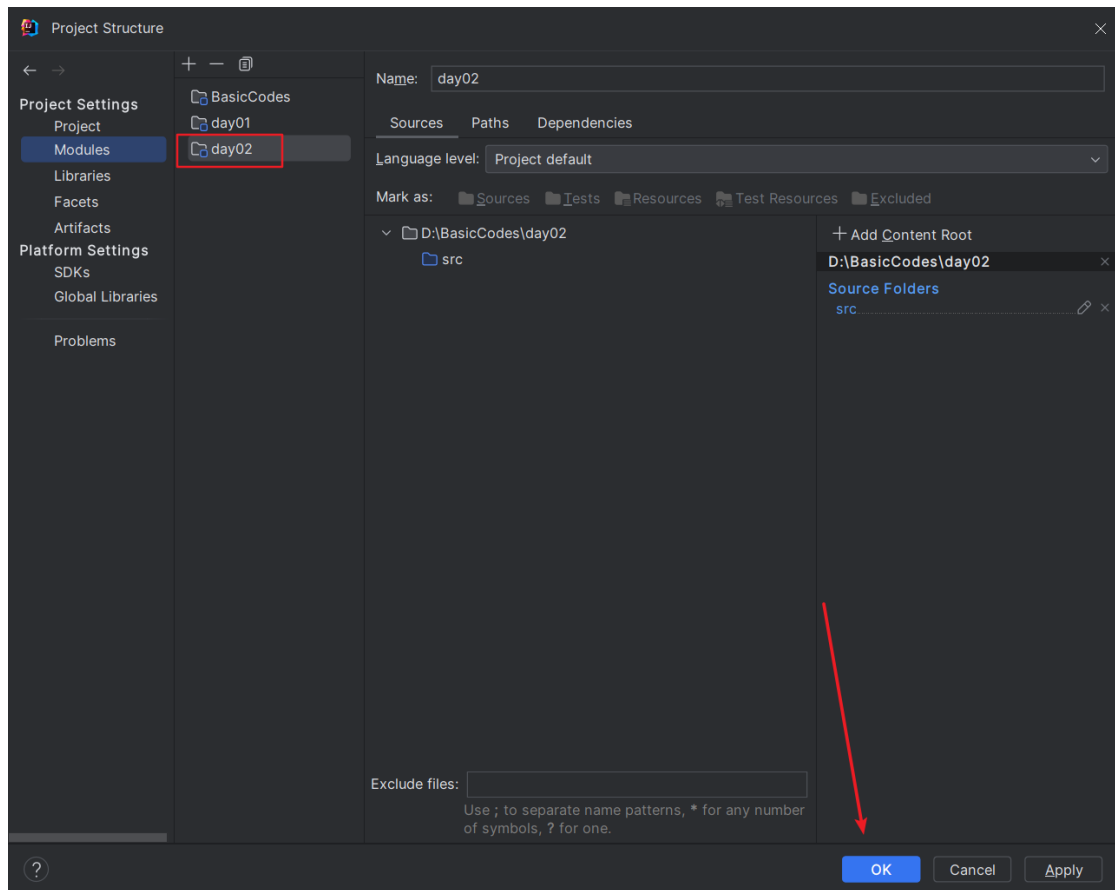

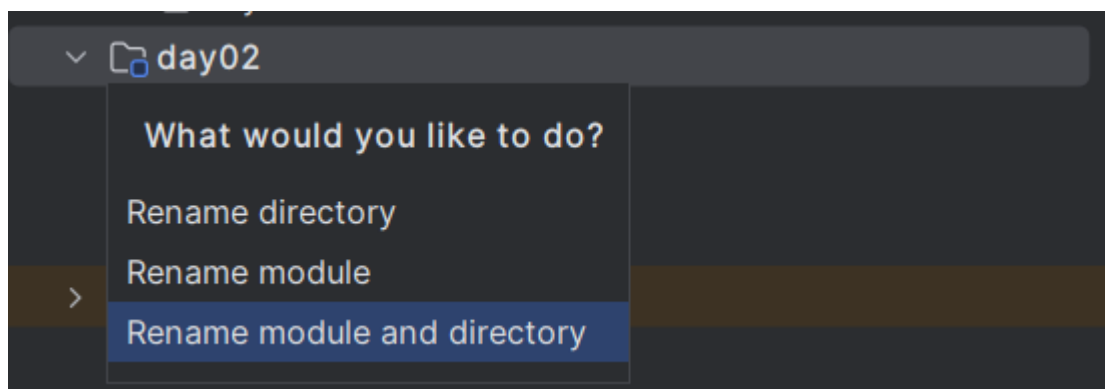

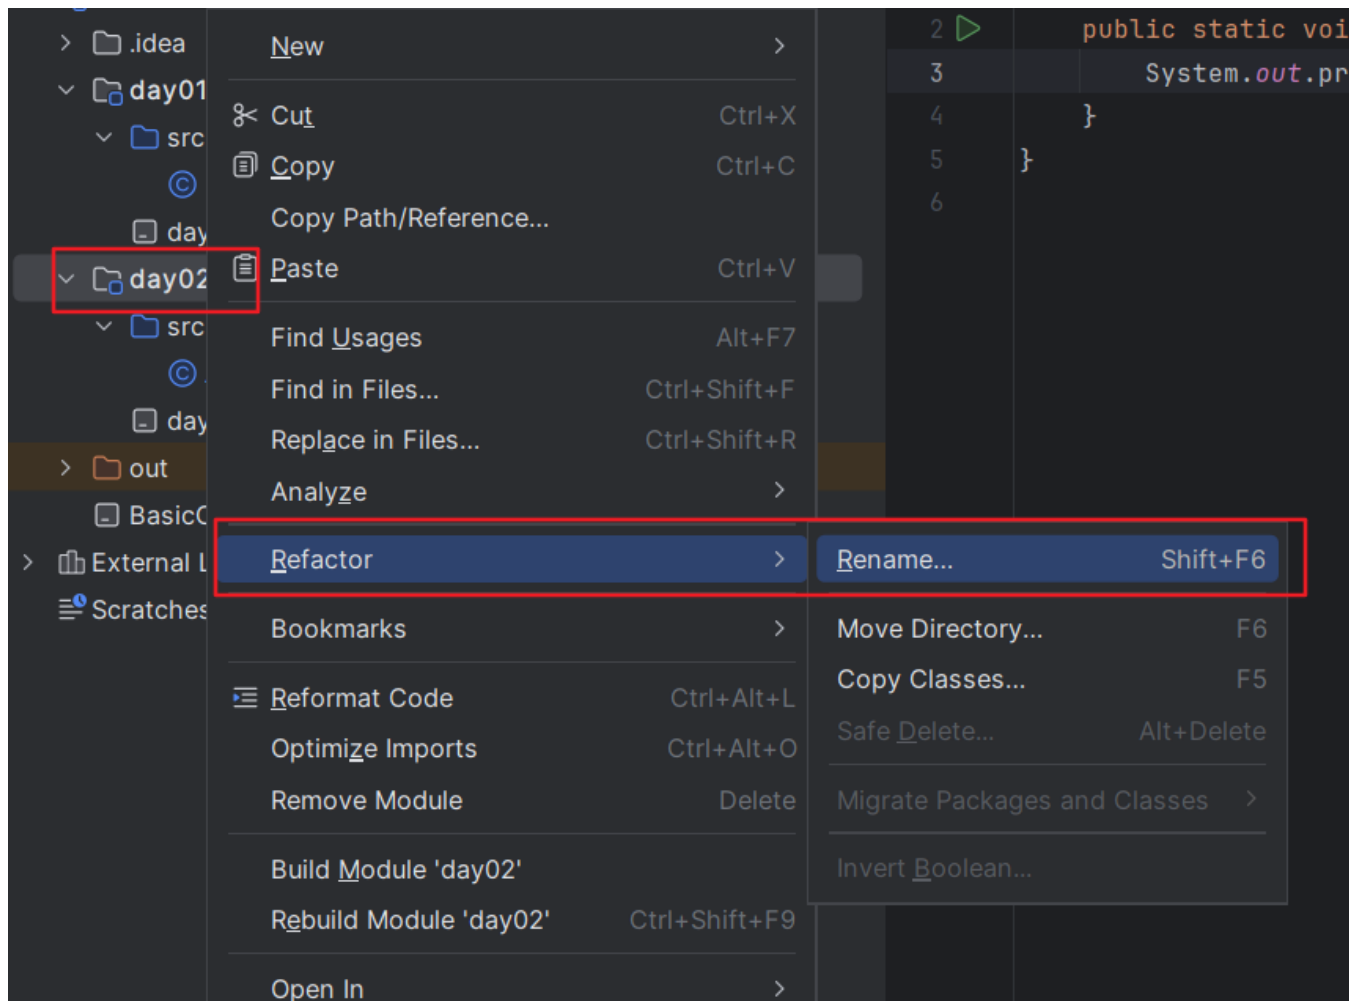

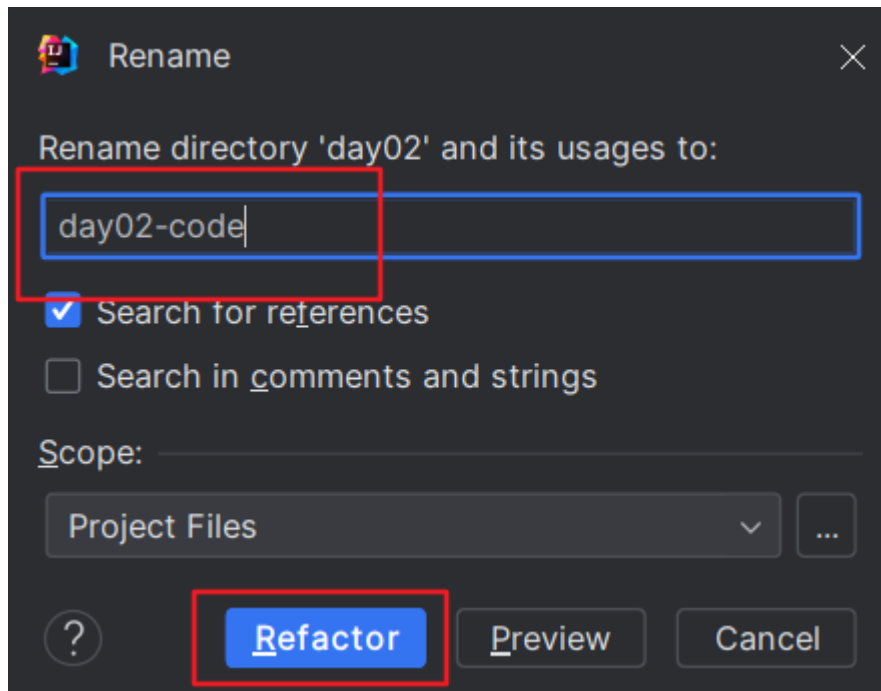

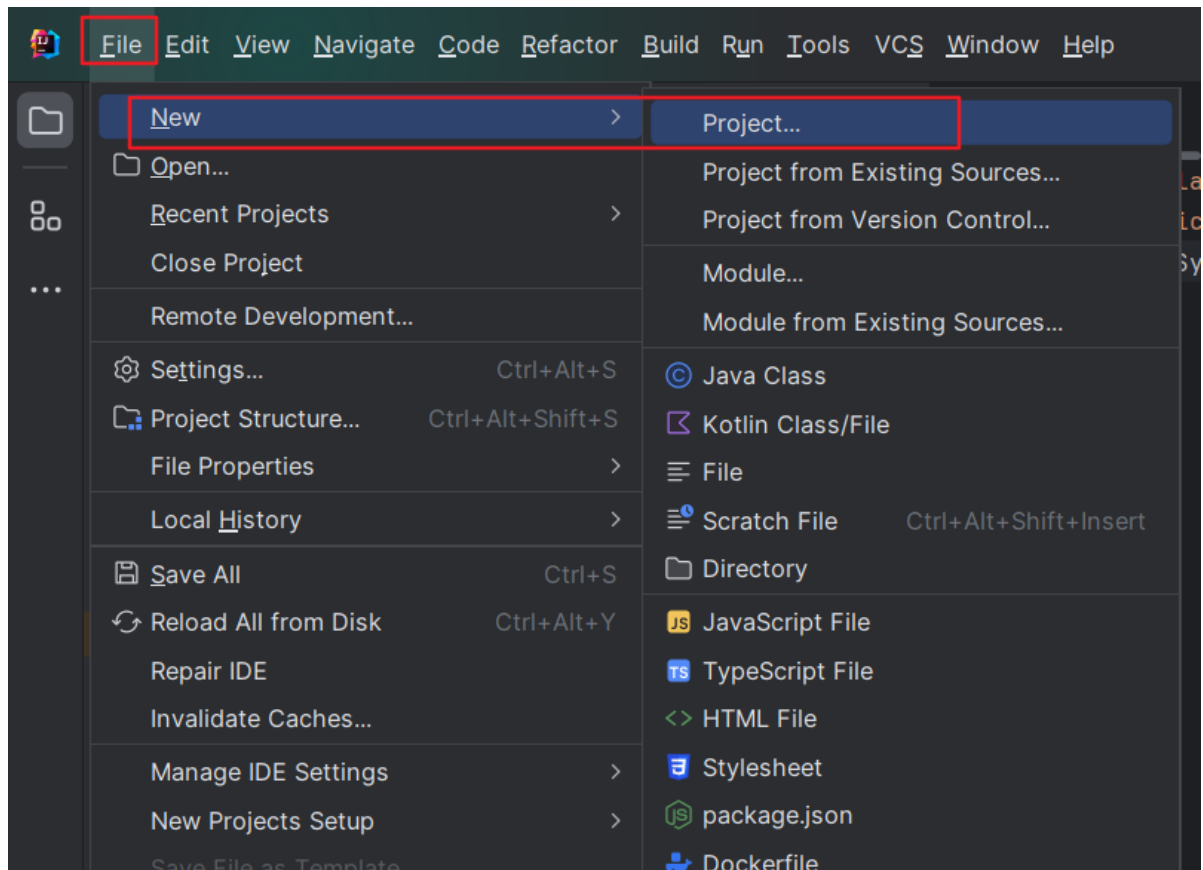

#### D. 修改模块

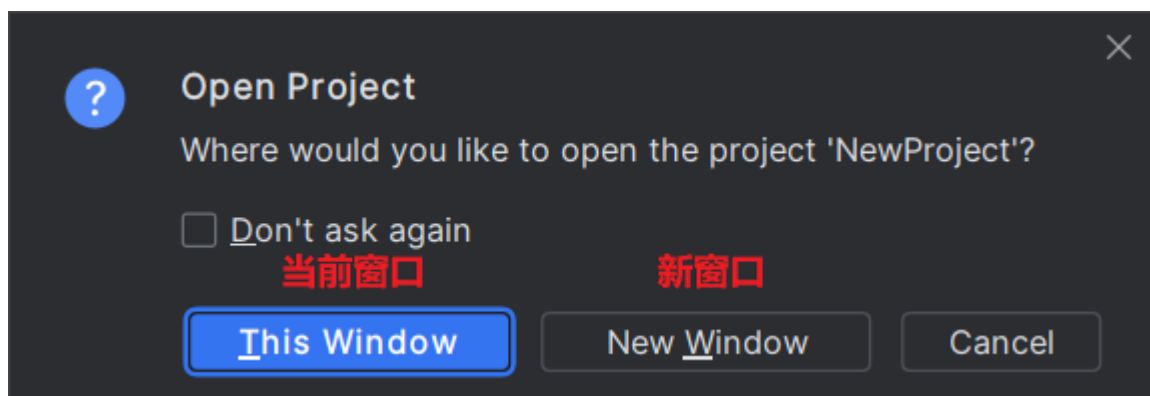

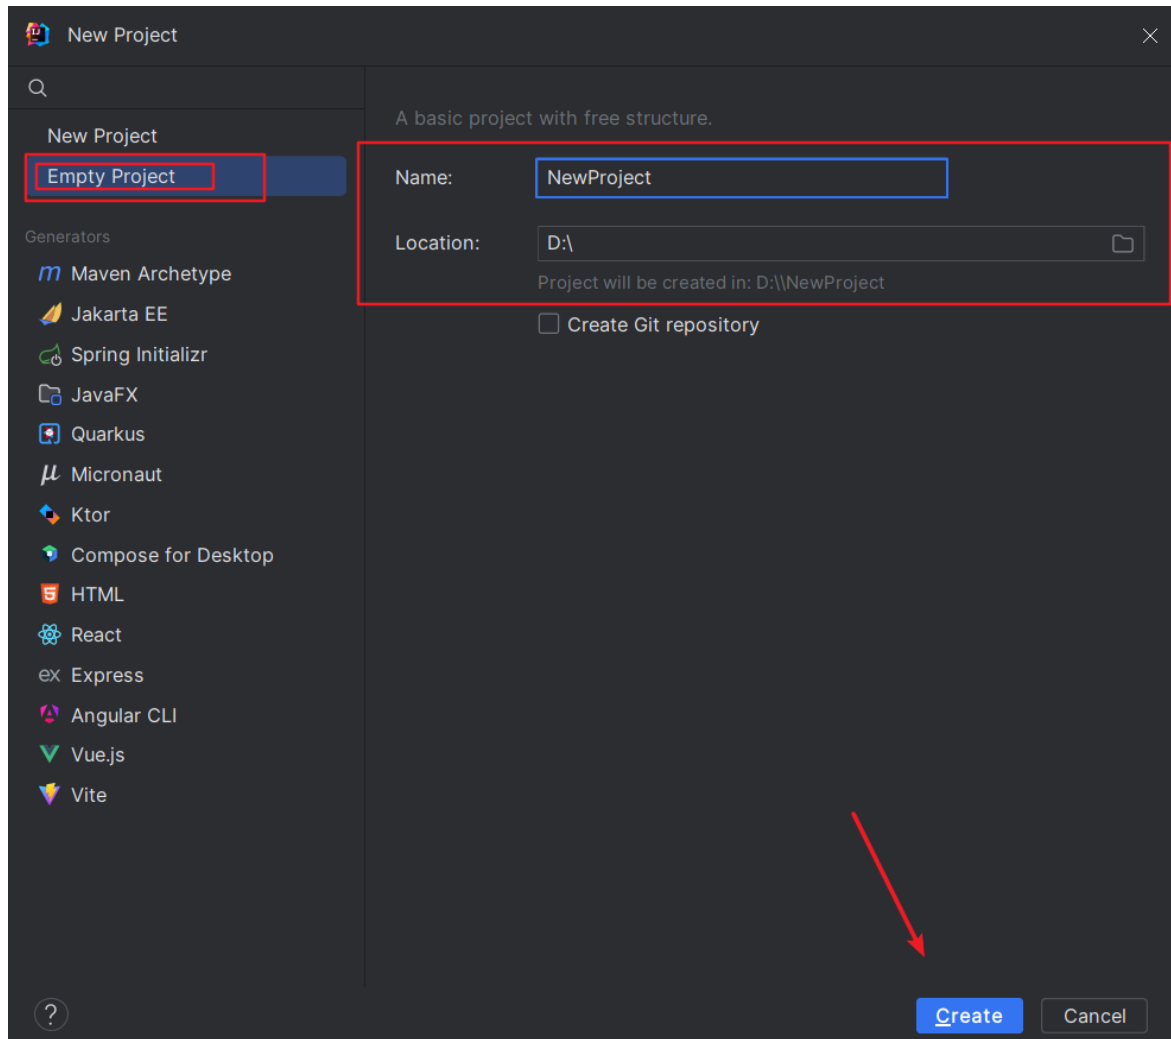

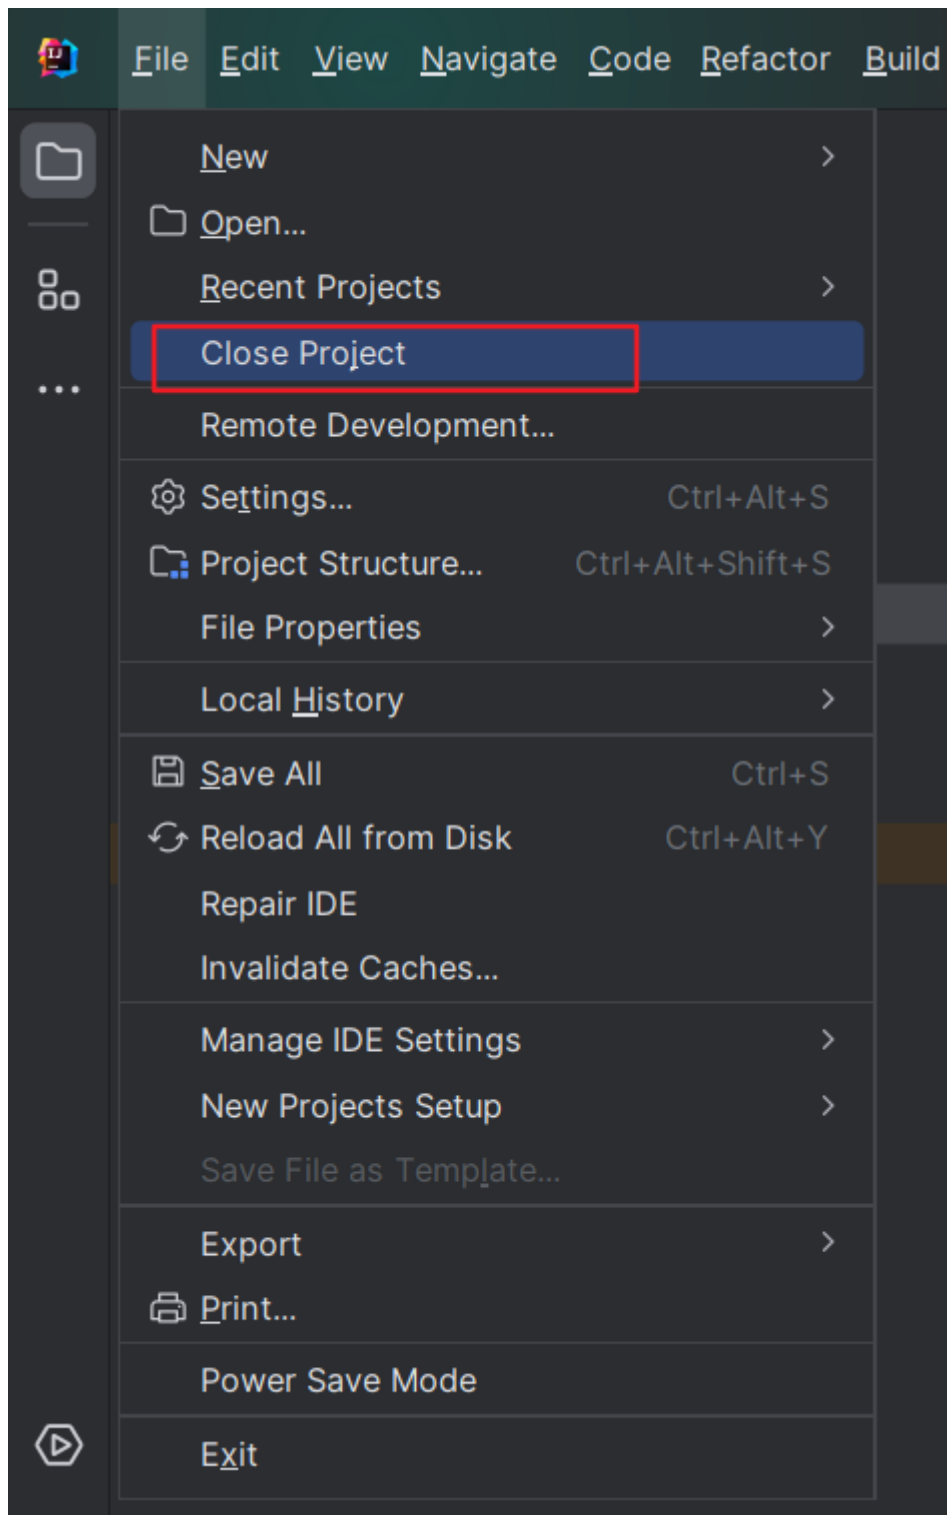

## 四、项目操作

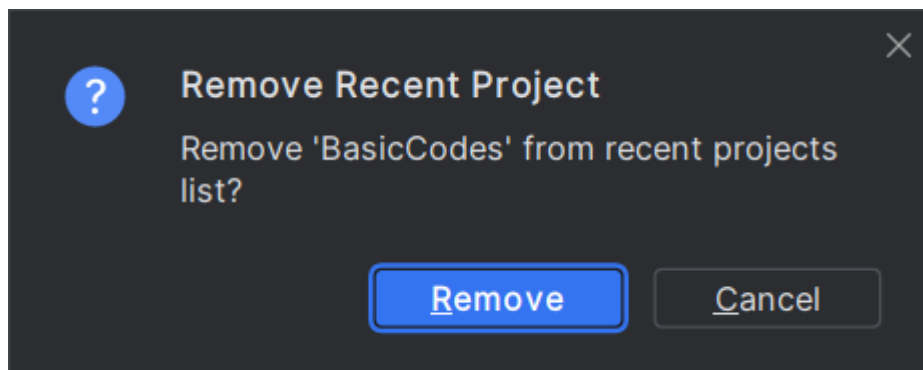

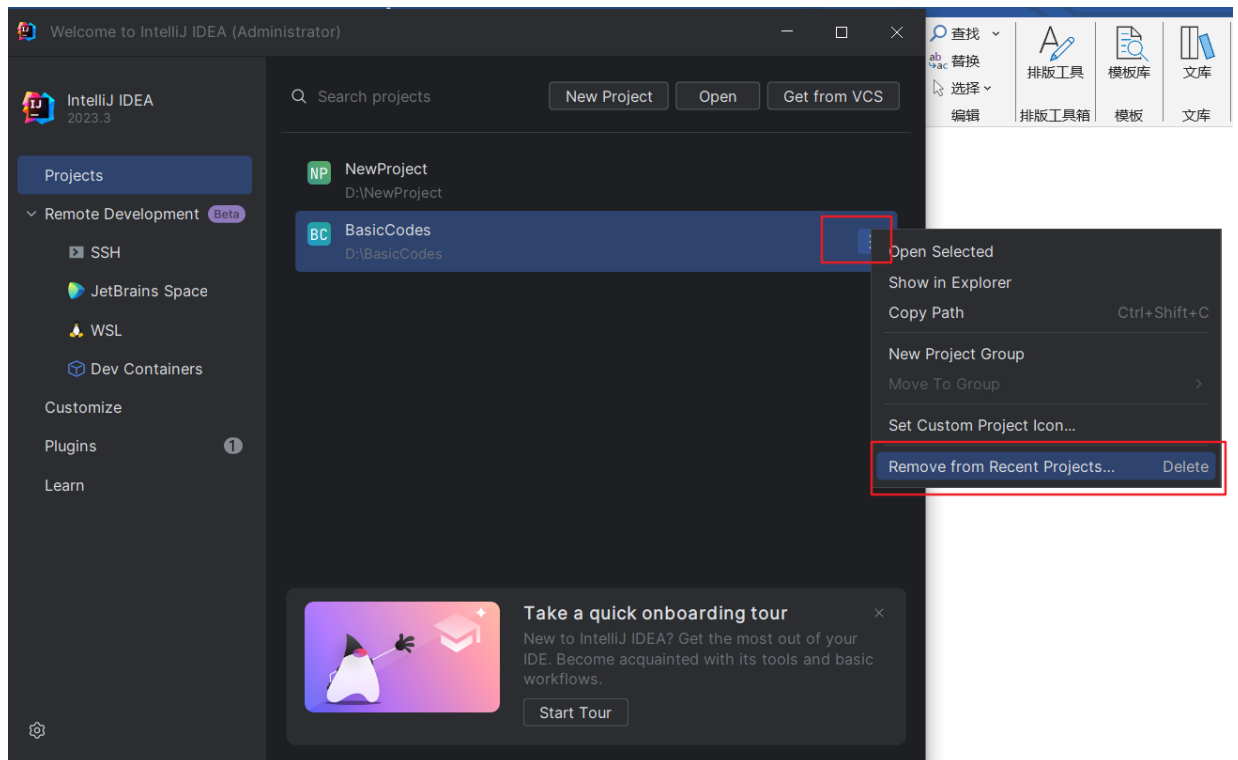

### A. 新建项目

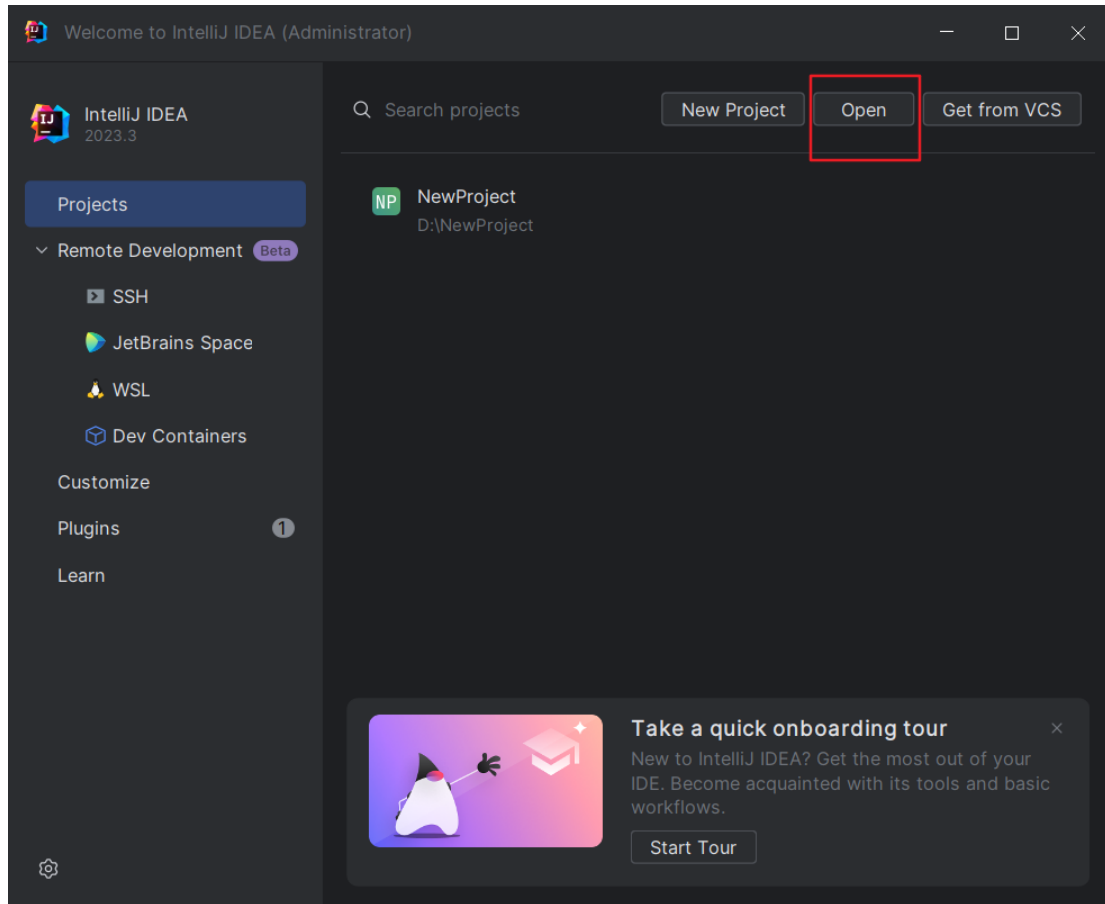

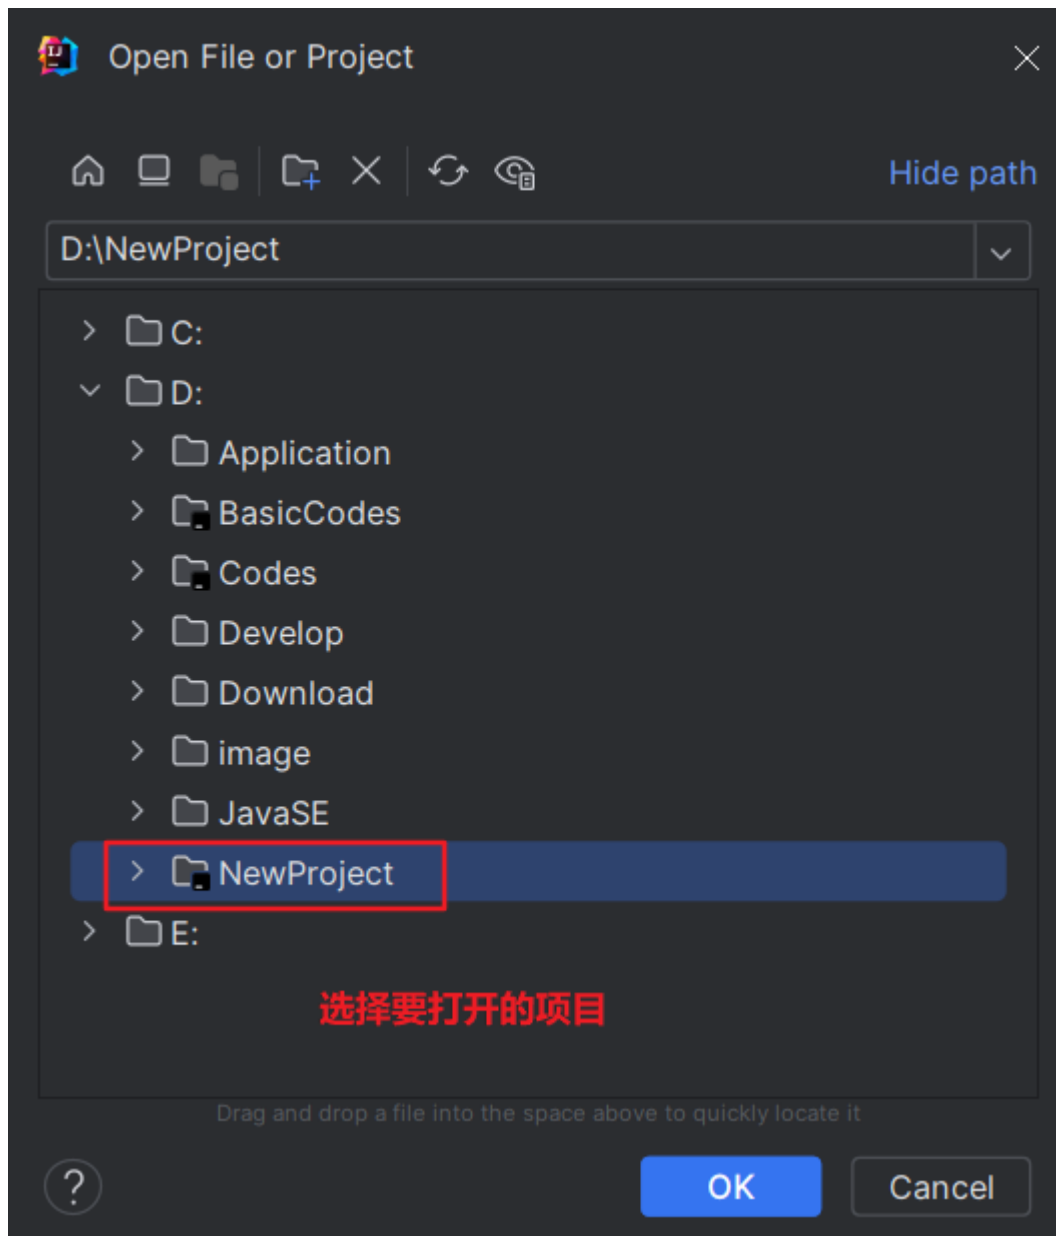

## B. 删除项目

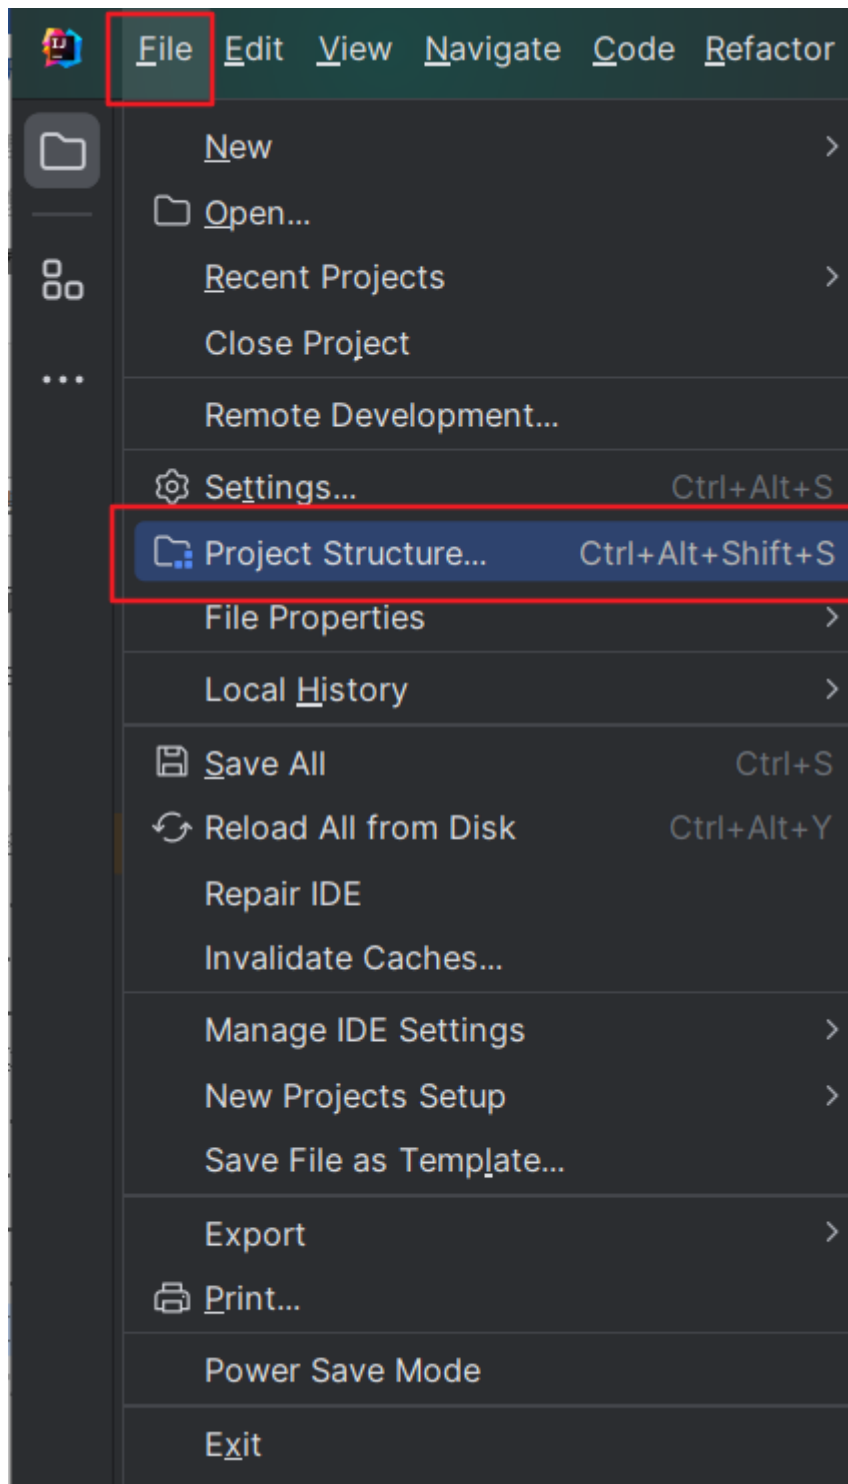

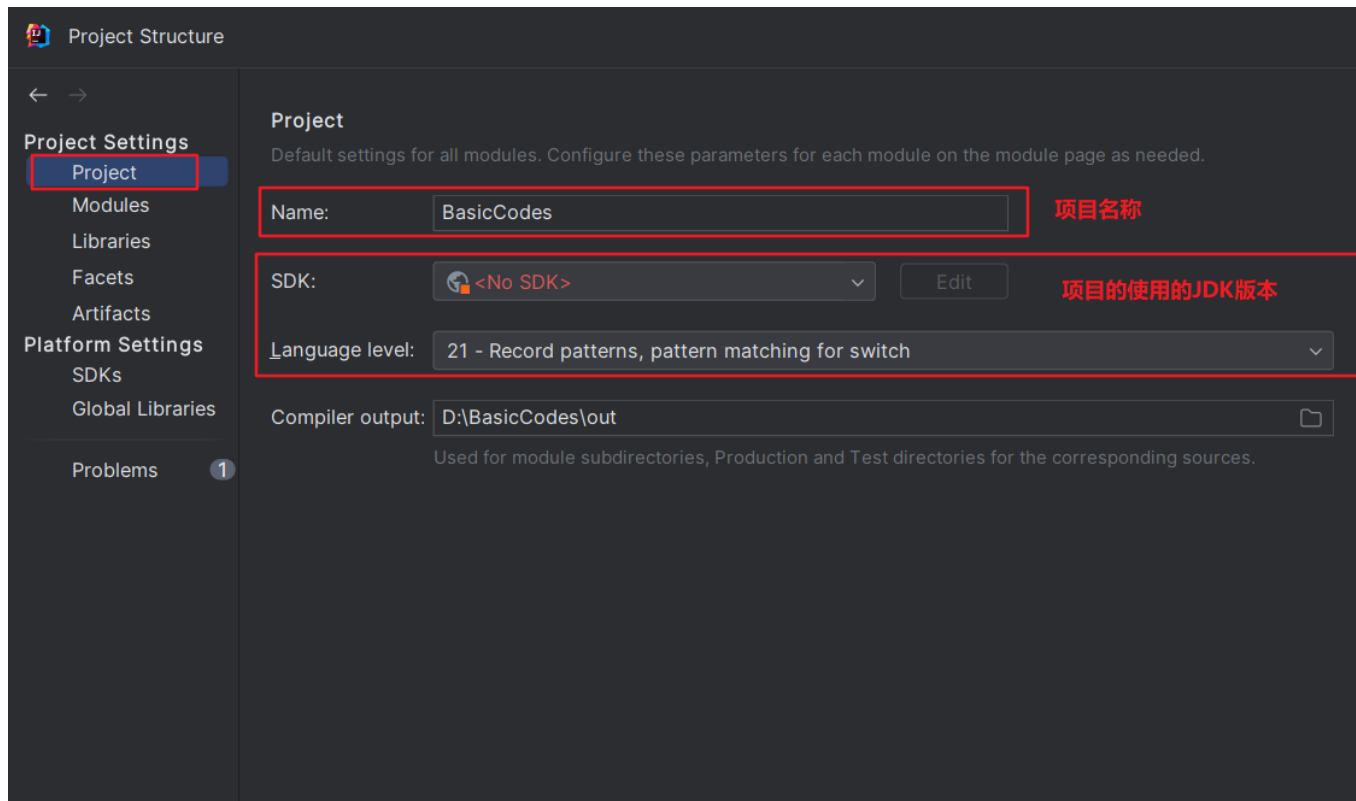

### C. 打开项目

#### D. 修改项目

## 五、常用快捷键

|                                 |                                                       |
|---------------------------------|-------------------------------------------------------|
| psvm + 回车                       | 快速生成 main 方法                                          |
| sout + 回车                       | 快速生成输出语句                                              |
| Ctrl + alt + L                  | 格式化代码                                                 |
| Alt + shift + ↑                 | 上移当前行                                                 |
| Alt + shift + ↓                 | 下移当前行                                                 |
| Alt+回车                          | 导入包,自动修正                                              |
| Ctrl+N                          | 查找类                                                   |
| Ctrl+R                          | 替换文本                                                  |
| Ctrl+F                          | 查找文本                                                  |
| Shift+F6                        | 重构-重命名                                                |
| Ctrl+X                          | 剪切当前行                                                 |
| Ctrl+D                          | 复制行                                                   |
| Ctrl+/<br>Ctrl+Shift+/<br>Alt+1 | 批量加入单行注释,再按一次就是取消<br>批量加入多行注释,再按一次就是取消<br>快速打开或隐藏工程面板 |
| F2                              | 高亮错误或警告快速定位                                           |
| Ctrl+F12                        | 可以显示当前文件的结构                                           |
